☐ AD on Permit

Comments: Precision Rathole Inc. drilled a 36" hole to 100' and ran new 30" conductor casing. O-Tex Pumping cemented the casing to surface with 370 sacks of class H cement. There were approximately 30 barrels of cement returns. Nomac Drilling rig 80 drilled a 17.5" hole to a depth of 979'. They had new 13.375" casing in the ground, and were circulating when I arrived. They had to wash the last 40' of casing in. O-Tex Pumping broke circulation and pumped gel spacer followed by cement. Good circulation was maintained throughout the mixing process and there were no significant increases in pressure. They released the plug and were 15.3 barrels into displacement when the well instantly pressured up to 1760 psi. They shut down and let the pressure fall below 1500 psi. They attempted to pump again and the pressure immediately increased again after 0.2 barrels of displacement. O-Tex tried this two more times with the same result. AEU shut the job down and let the cement set up. They drilled the cement out of the casing and had a cement bond log ran. The log showed the top of the cement at 240'. Nomac Drilling rig 80 ran 1" tubing to a depth of 140' in the annulus of the 13.375" casing. O-Tex Pumping grouted the casing with 630 sacks of class H cement. They installed the blow out preventer and pressure tested the surface casing at 500 psi. for 30 minutes. Nomac Drilling rig 80 drilled a 12.25" hole on air to a depth of 6507'. They ran new 9.625" casing, equipped with a multi-stage tool at 3408'. They were having problems getting the last 70' in and had to wash the casing down. O-Tex Pumping established circulation and pumped the first stage of the job. They landed the plug, increased the pressure by 500 psi and held for 5 minutes. Weatherford opened the multi-stage tool and O-Tex pumped to confirm the tool was open. Nomac 80 circulated through the tool for three hours. O-Tex hooked up and pumped the second stage of the job. Good circulation was maintained throughout with approximately 58 barrels of cement circulated to surface. Nomac Drilling rig #80 drilled an 8.5" production hole on air to the curve, at which time they went to drilling on oil-based mud. They drilled to a total depth of 16027' and ran new 5.5" casing. O-Tex pumping cemented the casing with 2370 sacks of cement. They reported 66 barrels of cement returns.
